ASTRAL · TMA METERPOWER GAP ANALYSIS · V1 AND V1.1

What Astral needs before TMA switches off

The TMA MeterPower walk-through on 15 October, Jac's MeterPower overview on 16 October, and a row-by-row check of requirements register v6 and the V1 scope sheet. 36 TMA capabilities in one register. Clive Richardson, 16 October 2026.

6	7	12	4	1	6
Critical. These block switch-off	High	Medium	Low	Already covered	Not worth rebuilding

Parity with TMA at 20 October

The aim: a TMA customer, and IMSERV Ops in TMA's admin console, can do everything they do today in Astral, or do it better. Shaun added two columns to Clive's register to test that. Parity asks whether they can do it in the prototype today. Next is the order the prototype work runs in. Of the 29 gaps, 17 are yes, 6 are partly, 4 are not yet and 2 are not a user task.

● **Yes** They can do it in the prototype, or better ◐ **Partly** They can do some of it ○ **Not yet** They cannot do it yet ○ Not a user task Data or migration work, no screen

1 Order of work

Next	Work	Parity	What is missing
1	M1: profile table per channel, with the summary block	○ Not yet	No 48-period table with max demand kVA and load factor
2	M2: Compare Data in three modes, with summary statistics	◐ Partly	One comparison mode; Shaun confirms modes 2 and 3
3	M9: Ops correct meter point details when the feed is wrong	◐ Partly	Ops can add meter points and change their site, but not correct other details
4	M11: placeholder meter until MOP details arrive	○ Not yet	No placeholder meter
5	M3: queries IMSERV raised on each meter point	◐ Partly	Customers see their own queries, not ones IMSERV raised
6	M6: Ops flow-load log and flow reports	◐ Partly	Servicing shows meter health; no flow-load log
7	M12: sub-meters	◐ Partly	Reports by meter class is marked as coming soon
8	M8: ROC and LEC, DUoS and TUoS	◐ Partly	Tariffs are on each site; the rest waits on the second session with Jac
9	L2: notices panel	○ Not yet	No notices for all customers
10	L3: Features and Help pages	○ Not yet	No help screens

H3 settled on 20 October. A site sits in one group for now; whether a site can sit in more than one group is to investigate. No sub groups. An admin or manager picks the groups or sites each person can see, when they invite them and on the person. A group includes sites added to it later. No feature rights: roles stay as they are.

The prototype only adds. Anything it already shows stays, including the Peak and off-peak values option that the drop list would not rebuild.

Bottom line

V1 as scoped replaces TMA's screens but not its data, feeds or complex-site handling, so on today's evidence it does not replace TMA.

- **The gap is the data, not the UI.** Channel-level data is a V1 row (Planned), but its detail is in neither the register nor the scope sheet. The July channel spec describes it and parks it outside V1: MSID, MQID mapped from source, effective-dated channels, many meters per MPAN. The import route was still unagreed on 7 Sep, and the register still holds channel data (J-R19) at V4, Open.
- **Complex sites have no home.** Complex and shared-supply sites use a settlement MPAN plus a pseudo MPAN for the raw meters, linked only by a spreadsheet. The settlement value is calculated, not summed: 9,307 against 9,359 from the raw meter on Jac's example.
- **TMA's 55 FTP customers sit outside the SFTP epic.** AST-E-01 (US-04) lists "TMA schedules (Doug's separate migration project)" as out of scope and covers push only. TMA also runs pull feeds.
- **The feed may not exist in time.** Channel data from IMSERV systems needs change of agent, and secondary-dial MPANs arrive through a dummy PRN file. No requirement row covers either.
- **V1.1 carries TMA parity it cannot afford to drop,** and the three "TMA-confirmed" V1 rows have no TMA source and no user story.

> Wave 1 (w/c 2 Nov) includes all 269 live TMA users, and TMA costs between about £120k and £133k a month. The sources disagree; see Conflicts. On this evidence TMA should not go in wave 1 unless the six critical gaps have named owners and dates at the go/no-go.

What the session showed TMA actually is

TMA (MeterPower v4.3.0, branded Dataserve UK, reached through the ScottishPower VPN) is a thin portal over a rich channel-level data store, plus an admin console Ops use to run the service. IMSERV loses access when the ScottishPower contract ends, and TMA declined admin access for Shaun.

Area	What we saw	Evidence
What customers use	Consumption report, generation report, Data Download. Carbon and TOU rarely; Bill Checker never; water and gas "wishful thinking"	Jac, transcript
Estate	1,652 logins, 269 used in the last 45 days (May snapshot); 13,664 unique MPANs across 50,340 group rows. Anna quoted about 12,500 in session	ELT transition deck v2; transcript
Appointments	64,665 appointment rows, open and closed, all organisations	Admin report screenshot
Largest group	All HH Scottish Water: 845 MPANs in one group, four FTP groups of 1,000+	Data Download screenshot; Jac
Ingestion	D0003 files load automatically; the morning file runs 15 to 17.6 MB, about 4,800 to 5,500 flows, 3 to 4.5 minutes. D0010 register-read files also load. Every file in the 1 to 14 Oct log shows zero errors	Log Viewer screenshots
Channels	Not fixed: standard 1 to 6, but Bathgate WWTW PV uses 1, 2, 8, 9. Import MPAN carries 1, 3, 6 (AI, RI, RE); export MPAN 2, 4, 5 (AE, RI, RE); the rest show "Unused". Channels are effective-dated per MSID	Profile and MPAN admin screenshots
Meters	Multiple meters per MPAN (one MPAN has 16) and multiple MPANs per site	Jac, Lorraine
Time basis	All data in GMT/UTC; help text warns of the one-hour BST offset	Features page
Access model	Organisation, Group, Sub Group; users sit at group level; a group grants features; master groups see everything; one MPAN can sit in several groups (customer, consultant, billing marker)	Jac walk-through; MPAN admin screenshot
Onboarding	Every customer set up by hand by an admin; no self-registration; MPANs added through the account manager	Anna, Help page
Feeds	Dataserve pulls data and sends it through Serafin, file server or email; customer self-scheduled email reports count as FTP and are charged	Jac, transcript
Support	Data Provisions mailbox (Sue, Jack on escalations) and the Supplier Help Desk, both IMSERV Scotland branded	Transcript
Data quality	Agreed site capacity read 0 kVA on all four profiles viewed; the PACE MPANs carry no site address	Profile screenshots

Gap register

Six gaps block switch-off on 31 Dec. Three are build (C1, C2, C5) and three are dependencies outside the Astral team (C3, C4, C6). Coverage today quotes requirements register v6 (row ID, version) and the V1 scope sheet (5 Oct status).

Critical: these block switch-off

ID	Gap	Coverage today	What closes it (owner)	Parity	Next
C1	Channel-level data model: MSID, channel, MQID (AI, AE, RI, RE) mapped from source rather than by channel position, effective-dated channels with a closed state, many meters per MPAN. Channel numbers vary by meter operator (1, 2, 8, 9 seen)	V1 row "Meter / channel level data", Planned. J-R19 still V4 Open, "awaiting scope + data-model check". E2E plan, 7 Sep: "need to agree import route. Needs Data Engineer"	Commit the model and import route as V1; re-version J-R19 on the Challenges tab (Gordon, Anna)	● Yes	
C2	Register reads (D10): loaded by hand once a month today; customers view and export them; export customers need a monthly export total to claim FIT, Scottish Water for Ofgem reclaim	ST-04 (V1) covers viewing register reads; a register readings output file reached UAT on 14 Oct. Nothing covers D10 ingestion or monthly export totals; SCW-1 export view is a V1.1 candidate only	Add D10 ingestion and a monthly export total per export MPAN to V1 (Anna, data team)	● Yes	
C3	Source feed: channel-level data, D10 reads and secondary-dial MPANs arriving automatically; depends on change of agent	No requirement row. The TMA workbook lists it only as dependencies ("Secondary Dial to be set up", "Update the master CoA plan")	Change-of-agent date per cohort and feed confirmed (Lorraine, Lisa)	○ Not a user task	
C4	History before access ends. IMSERV systems lack channel-level history for these MPANs, and TMA Group is for sale	Generic only: ST-13 historic load; "Access to historical data", To scope. TMA workbook question "Data Extract from TMA for continuity of data? How long, ..." unanswered	Extract plan and retention period agreed (Anna, Tricia)	○ Not a user task	
C5	Complex sites, shared SVAs, pseudo MPANs. The settlement MPAN (meter "COMPLEX") carries a calculated value; a 99-prefixed pseudo MPAN carries the raw meters; the link lives only in a spreadsheet; calculated and raw totals differ. The TMA workbook holds 121 99-prefixed MPANs, mostly Welsh Water, FTP and Mercia	None. ST-R6 and J-R12 concern DataVision dummy MPAN labels. TMA workbook, pot 12: "Risk as very complex... 4 weeks effort by Ian Hall"	Model the settlement and pseudo pair; calculated values arrive from upstream, never recomputed; the linking spreadsheet becomes migration data (Gordon, Lisa)	● Yes	

ID	Gap	Coverage today	What closes it (owner)	Parity	Next
C6	TMA FTP feeds: 55 customers (17 include meter serial, 2 not consolidated by MPAN); pull to Serafile and push to customer servers; a charged service	V1 SFTP row exists, but epic AST-E-01 (US-04) lists as out of scope "TMA schedules (Doug's separate migration project)" and covers push only	Confirm Doug's project scope, owner and date, or bring TMA feeds into AST-E-01 (Anna)	● Yes	

High, medium and low

ID	Gap	Coverage today	Rating	What closes it (owner)	Parity	Next
H1	Data Download options: MQs, kWh or kW, actuals only, A/E flags on or off, consolidate by MPAN, aggregate by group, MSID, site details, interval, cumulative or TOU; search across 845 MPANs; runs as a background job	"Data download / export" Partial; LCC-03, ST-02, VMO2-R2, ST-R1, VR-03 (V1) are generic; the option set is unspecified	High	Parity spec from Jac's option list; golden extracts as acceptance tests (Anna, Jac)	● Yes	
H3	Organisation, Group, Sub Group access with group-level feature rights; one MPAN in many groups (12,803 of 13,658 MPANs sit in more than one, up to 11)	JV-R1, ST-R5, SW-04, VR-04 (V1); SCW-11/12 V1.1 candidates. "Group Functionality" is MVP+ in the tracker but V1 in the scope sheet	High	Settle the version conflict as V1; confirm many-to-many (Gordon)	● Yes	
H4	Generation and consumption reports, the main reasons customers log in	Generation widget Built; GS-R8 and ST-11 (V1) cover import and export data; no named reports	High	Add both as V1 report rows (Anna)	● Yes	
H6	Related import and export MPAN pairs; MPAN type	ST-11 per-site import/export flag only	High	Add related MPAN to site attributes (Gordon)	● Yes	
H7	Users with no email (about 308 of 1,653 user rows in the TMA workbook; the ELT deck counts 1,652 logins); third-party authorisation held in free-text notes	VR-11 (V1) moves login and reset to email, which conflicts. LOA row Built per the 7 Sep E2E plan, To scope per 5 Oct	High	No-email rule in the transition plan; notes into the authority gate (Anna, Tricia)	● Yes	
H8	Stale portfolios: a D0151 does not reliably close the link and nothing removes sites afterwards	GS-R3 (V1) de-appointment notification only	High	Cleanse against current appointments before migration (Lisa, Tricia)	● Yes	
H9	Three data cuts a day (about 7:30, 9 to 10 and 3 to 4pm)	TW-01, ST-05, JV-R18, LCC-08, VMO2-R8, SW-01 (V1) cover freshness; none states intraday	High	Confirm refresh frequency or tell customers (data team)	● Yes	
M1	Profile table: 48 periods per channel, kW, kWh or kVA, transpose, summary of total, max and min, max demand kVA and load factor	Tabular interval view To scope; Statistics tab Built	Medium	Specify per channel with the summary block (Shaun)	○ Not yet	1
M2	Compare Data in three modes, with summary statistics	Comparison overlay Partial; SCW-9/10	Medium	Confirm modes 2 and 3 (Shaun)	◐ Partly	2
M3	Enquiry: read-only history of queries IMSERV raised per MPAN	Capture-only flag in V1; query management through Salesforce, 2027	Medium	Accept; say so in comms (Anna)	◐ Partly	5
M4	Alarm report and alarm email	Alerts Not started	Medium	Usage unknown (Jac cannot see it); decide with account managers (Anna)	● Yes	
M5	All data in GMT	Report content includes UTC	Medium	Default TMA exports to GMT (Gordon)	● Yes	
M6	Ops monitoring: flow log, flow listing, channel overlap, flow loading reports	Not in portal scope	Medium	Name where ingestion monitoring lives (Lisa)	◐ Partly	6
M7	Support through the Data Provisions mailbox and Supplier Help Desk; Katie Horton runs onboarding and FTP links	No portal-wide support row; DD-10 covers document delivery only	Medium	Route into the tier model before wave 1 (Anna, Pippa)	● Yes	
M8	ROC and LEC, tariffs, DUOS and TUOS, category	ROC and LEC V3; tariffs In progress; DUOS and TUOS not itemized	Medium	Second session with Jac (Anna)	◐ Partly	8
M9	Manual MPAN maintenance when the feed is wrong	Address read-only; no channel admin	Medium	Define the exception route (Lisa)	◐ Partly	3
M10	Agreed capacity 0 kVA and missing addresses on MPANs viewed	Address read-only from source; V1.1 capacity relies on customer entry	Medium	Size ASC and address coverage (data team)	● Yes	
M11	Dummy meter held against an MPAN until MOP technical details arrive	None	Medium	Model allows a placeholder meter (Gordon)	○ Not yet	4
M12	Sub-meters to set up (TMA workbook: "500 / 900")	JCH sub-metering treatment; SCW-4 candidate	Medium	Confirm count and treatment (Lisa)	◐ Partly	7
L1	Carbon report	Site emissions Planned	Low	Covered once built	● Yes	
L2	Notices panel	Not itemized	Low	Banner on the help framework	○ Not yet	9

ID	Gap	Coverage today	Rating	What closes it (owner)	Parity	Next
L3	Features and Help pages	Help screens Planning	Low	Covered	○ Not yet	10
L4	Simulate User View (broken in TMA today)	Login as a user Planned	Low	Covered	● Yes	

> Already covered: missing and estimated data. WS-27, ST-14 and JC-R1 (V1), the data quality flags row (Planning) and story 4070 cover it. Jac says it is the main reason customers raise queries (N/A for missing, blue for estimated, ND for no data), so it must not slip.

V1.1 is carrying TMA parity

Three of the nine V1.1 candidates are things TMA customers have today, and a fourth (data health) exists in basic form. Yet the 6 Oct migration plan defines V1.1 as the droppable tranche, cut first if V1 slips. Anything a TMA customer needs on 1 Jan cannot sit there.

V1.1 candidate	TMA has it today?	Position for TMA switch-off
Export and sub-meter channel data (SCW-1)	Yes: channel view, export MPANs	Move to V1 (part of C1, C2); also re-version J-R19 from V4
Group-by-class reporting (SCW-4)	Yes: groups such as All HH Scottish Water, All AMR Sites	Move to V1
Granular and framework access (SCW-11, 12)	Yes: sub-groups scope consultants	Move to V1 (H3; also a version conflict, MVP+ against V1)
Data-health view	Basic form: missing and no-data reports	Basic reporting already V1 (WS-27, ST-14, JC-R1); rich view stays V1.1
Capacity and kVA	Partly: ASC and max demand kVA on the profile	Stays V1.1; ASC data is thin (M10)
Threshold alerts with LOA status	Partly: alarm report and email	Stays V1.1 unless alarm usage is material (M4)
Cross-site league tables	No	Stays V1.1
what3words overlay	No	Stays V1.1
Company-level map	No	Stays V1.1

One definition to settle: the sources use V1.1 three ways. The register documents treat it as the pull-forward candidates above. An earlier prototype session scoped it as Portfolio, Reports, Alerts, Queries, Settings and Notifications. The ELT transition deck uses it for CRM-enforced access. This analysis uses the register definition (Reports v1/v1.1 document, 24 Sep). The locked register has no V1.1 column, only V1 to V4, so nothing in V1.1 is formally committed.

Where the session challenges current V1 rows

The three "TMA-confirmed" rows added to V1 do not match what TMA does. The TMA requirements folder holds one document, Portal Requirements.docx, which reads as a generic best-practice list for a commercial energy portal, not a TMA baseline. The rows look derived from it, though that is inference. What is fact: the scope sheet calls them "directed additions", the 15 Sep story reconciliation marks all three "NO STORY", and no interview or TMA document supports them. One traces to a register row: external data ingestion maps to MO-R4 (V1), a third-party and sub-metering upload need, not a TMA one. "Supplier D3" may be a mislabelled D0003, the standard half-hourly flow.

Current V1 row	What the session showed	Proposed rewrite
Meter read submission (user submits a read)	Customers do not submit reads in TMA. IMSERV loads D10 register reads and customers view and export them	Register read (D10) ingestion, display and export, plus monthly export totals (C2)
External data ingestion (for example, supplier D3)	Manual upload of D3, PRN/MTD, site setup and appoint/assign files is an Ops workaround; Lorraine wants it automated	Automated feed for appointed and secondary-dial MPANs, channel-level, from the governed layer (C3); manual upload as an admin exception only
Data collector / aggregator (DC/DA) reports	No DC/DA report was shown. "DC/DA Customer Invoicing via CDAM" is a billing-marker group, not a report	Replace with the generation and consumption reports customers actually use (H4); confirm whether any DC/DA report exists

- **The walk-through is the baseline the migration plan asked for, half done.** The 6 Oct plan made a TMA baseline the gating item. The session largely answered section A and questions 16, 17, 19, 20, 22, 27 and 30 of the 45 baseline questions, and part of 23. Sections B (estate depth), G (contracts) and H (switch-off) are untouched.
- **Lorraine's scope guard is useful.** Several admin functions exist to run IMSERV's own processes (billing groups, manual site setup) and need not come into Astral, but Ops must own those processes somewhere else before TMA goes.

Drop list: do not rebuild

Six TMA features should not come into Astral on the evidence so far. Each still needs one line in customer comms or an Ops owner. Usage data does not exist (Jac cannot see what customers access), so this rests on query history and judgement.

Feature	Evidence	Action	Parity	Next
Bill Checker	Jac: never used, never had a question about it; turned on only on request	Drop. Scottish Water validate bills from exported data, which H1 covers	◐ Partly	
Water and gas commodities	Jac: "wishful thinking", irrelevant	Confirm before dropping: the TMA workbook holds gas MPRNs, which contradicts Jac	● Yes	
TOU data download option	Jac: not many use it; the estate is mostly half-hourly	Drop the option; keep TOU registers inside D10 export (C2)	● Yes	
Billing-marker groups (for example, "A. DC/DA Customer Invoicing via CDAM")	Used to tell the billing team what not to bill; Lorraine: business process, not portal	Ops moves the marker to the billing system or Salesforce before switch-off	○ Not a user task	
Manual upload screens (PRN/MTD, flow, site setup, appoint/assign, tariff)	Most loading is automated; manual is the workaround	Replace with the automated feed (C3); keep one admin exception route (M9)	◐ Partly	
MDR Scheduler	The dialler's desktop tool, shown alongside the portal	Out of Astral scope; stays with data collection	○ Not a user task	

Conflicts and open questions

Nine facts disagree across sources. Each needs one answer before the ELT sees the TMA wave again.

Item	What the sources say	Who settles it
MPANs in TMA	13,664 unique (workbook note); 13,658 counted in 50,340 group rows; about 12,500 (Anna, in session)	Lorraine
MPANs to migrate	5,098 "To Migrate" across the workbook's pots; pot 11 Scottish Water 403; Scottish Water groups hold 4,741 unique MPANs; "Scottish Water: 6,000 sites" (Granola, 24 Aug)	Lorraine, Emma Stewart
TMA monthly cost	£133k slip cost (confirmed Sept); about £120k (migration plan); £77k a month plus the £50k TSA data line, about £130k (Granola)	Amy
TMA notice period	30 days (24 Aug) against 60 days (3 and 7 Sep)	Tricia
Which users get set up	Session: active in 6 months or on the FTP list; ELT Decision 3: full parity, dormant created dormant; workbook: 45 days	Lisa, Clive (ELT Decision 3)
Gas and water	Jac: "wishful thinking"; the TMA workbook holds gas MPRNs	Jac
Channel data version	Confirmed V1 (12 Aug) and a V1 scope row; J-R19 still V4 Open in the locked register	Anna (Challenges tab)
SFTP and LOA build status	Built (E2E plan, 7 Sep); To scope (scope sheet, 5 Oct); no user story (reconciliation, 15 Sep)	Danny
Wave 1 content	All 269 live TMA users w/c 2 Nov (ELT deck) against C1 to C6 open	Go/no-go

Still open

- ROC and LEC: what is calculated or reported, and for which clients?
- Tariffs, DUOS and TUOS, Category: used by customers, by Ops, or not at all?
- How many years of history must come across, by channel?
- Shared SVAs (Infinis): now part of C5. How many complex and shared SVA sites are there?
- Full feed inventory: every FTP and email recipient, file format and schedule (on SharePoint; access pending).
- Charging: FTP is a chargeable service today. Does that charge continue in Astral, and who bills it?
- Where TMA users land: Astral V1 or ADS/MSA with no portal (ELT Decision 5: Lisa and Anna to decide, not yet confirmed).
- External parties who must change something when TMA stops, and their lead times (baseline section H).
- The D3 sample file Lorraine offered to share: check it arrived.
- TMA Group is for sale (logged 30 Sep). Does that change export cooperation for the history extract in C4?

Actions before the go/no-go

Clive is away w/c 19 Oct, so every action has an owner who is not Clive. The test for TMA in wave 1: C1 to C6 each have an owner and a date. If not, TMA users move out of wave 1 and the ELT is told the monthly cost. The ELT deck dates the go/no-go 24 Oct, a Saturday; Anna to confirm the real date.

- [ ] Name who holds the TMA decision while Clive is away (Clive, 16 Oct)
- [ ] Grant SharePoint access to the IMSERV Scotland Project site for Clive, Anna, Gordon and Shaun; Clive's account is currently denied (Lorraine, 20 Oct)
- [ ] Change-of-agent date per TMA cohort; confirm channel-level, D10 and secondary-dial MPANs reach the governed layer before wave 1 (Lorraine, Lisa, 20 Oct)

- [ ] Size C1, C2, C5, H3 and H6: channel model, D10, complex and pseudo MPANs, many-to-many groups, related MPANs (Gordon, Danny, 20 Oct)
- [ ] Confirm Doug's TMA feed migration project: scope, owner, date, pull and push (Anna, 22 Oct)
- [ ] TMA history extract plan and retention period (Anna, Tricia, 22 Oct)
- [ ] Challenges tab: re-version J-R19 to V1; settle Group Functionality as V1; add D10 ingestion, export totals, generation and consumption reports, related MPANs; rewrite or remove the three unsourced TMA rows (Anna, 22 Oct)
- [ ] Portfolio cleanse against current appointments, and the no-email user rule (Lisa, Anna)
- [ ] Golden extracts and FTP files saved while access remains (Jac)
- [ ] Second session with Jac: ROC and LEC, tariffs, DUOS and TUOS, gas and water, complex site count, history depth, switch-off dependencies (Anna, 23 Oct)
- [ ] Settle the nine conflicts above, each with its named owner (Anna)
- [ ] Use this register as the test script for Shaun's show-and-tell (Shaun)
- [ ] Decide TMA's place in wave 1 against the test above (Go/no-go group)

Sources and method

All 46 walk-through screenshots were viewed as images, alongside the full transcript and the six images in Jac's overview. V1 status is as recorded in the scope sheet on 5 Oct and may lag the build. An independent review checked requirement IDs, quotes and numbers against the source files; its corrections are included.
